Historical events

2 historical event record(s) are stored for W019. Each item below is copied from the synthetic events table.

Historical event at 1112.6 m in Formation-B. Event type: STUCK_PIPE. Severity: HIGH.
Observation: Drill string experienced elevated resistance and became temporarily stuck.. Cause:

Increasing torque and declining rate of penetration in a mechanically unstable interval.. Mitigation: Circulation, controlled WOB reduction, and reciprocation of the drill string.. Outcome: Drilling resumed after controlled freeing operation..

Historical event at 2162.8 m in Formation-C. Event type: MUD_LOSS. Severity: HIGH. Observation: Mud volume loss was observed during drilling.. Cause: Losses into a permeable or fractured formation interval.. Mitigation: Reduced pump rate and applied controlled lost-circulation treatment.. Outcome: Mud losses stabilized and drilling continued..

Source statement

All well, formation, drilling-log, and event values in this PDF were copied from the local NWIS synthetic PostgreSQL database. The document does not add wells, depths, causes, mitigations, or outcomes that are absent from those tables.
